Björn LDM Brücher and **Ijaz S. Jamall** are Fellows of the Theodor-Billroth-Academy®, its International Consortium of Research Excellence (INCORE), and members of the European Academy of Sciences and Arts. In 2014, Drs. Brücher and Jamall published a new paradigm on how cancers develop. This was followed by 16 peer-reviewed papers that explain in detail how most solid cancers originate and the first cancer cell develops. Applying these concepts will help to prevent cancer growth and impede, block, or reverse the spread (metastases) of solid cancers. Studies on cancer epidemiology show some improvements, but no substantial decrease in the overall rate of cancer deaths or metastases over the past 50+ years.

Our Hope

The Cancer Metastases Research Fund, a 501 (c)3 nonprofit was founded to support studies on the development and spread of cancer. The new approach is designed to hinder the mechanisms that lead to cancer progression, and even its very formation. Our hope is not just to “buy time” for patients, but to develop affordable therapies that will make the scourge of cancer and its spread a thing of the past.

Imagine a world without cancer!
